# Lessons from the human microbiome field: Pre-analytical variables for reliable non-human biobanking and research

Cornelia STUMPTNER<sup>1</sup>, Tanja KOSTIC<sup>2</sup>, and members of the MICROBE Consortium<sup>3</sup> and EPSO WG 'Plants and Microbiome'<sup>4</sup>

<sup>1</sup> Medical University of Graz, Diagnostic & Research Center for Molecular Biomedicine, D&R Institute of Pathology, Austria; <sup>2</sup> AIT Austrian Institute of Technology, Center for Health & Bioresources, Austria; <sup>3</sup> EU-project MICROBE No. 101094353 (<https://www.microbeproject.eu/consortium/>); <sup>4</sup> European Plant Science Organisation's (EPSO) Working Group 'Plants and Microbiome' (<https://epsoweb.org/working-groups/plants-and-microbiomes/>)

## Introduction & Problem

Microbiome research increasingly relies on the availability of high-quality biobanked microbiome samples and metadata, as well on the reuse of samples, metadata and analysis data.

**The pre-analytical phase is a vulnerable and decisive part of microbiome research, strongly affecting sample, data reliability and comparability, as well as sample and data reuse.**

In the human microbiome field, the European "quality standard" CEN/TS 17626:2021 (developed with contributions from SPIDIA4P and Medical University of Graz/BBMRI.at) provides established guidance for pre-analytical processes.

**However, pre-analytical aspects in non-human microbiome biobanking and research (e.g. plant, soil, marine) remain often insufficiently addressed or underestimated.**

## Aim

The aim was to identify the pre-analytical workflows and define potential sample-type-specific pre-analytical variables and metadata for non-human sample types by transferring concepts from human microbiome standardization to environmental microbiome research.

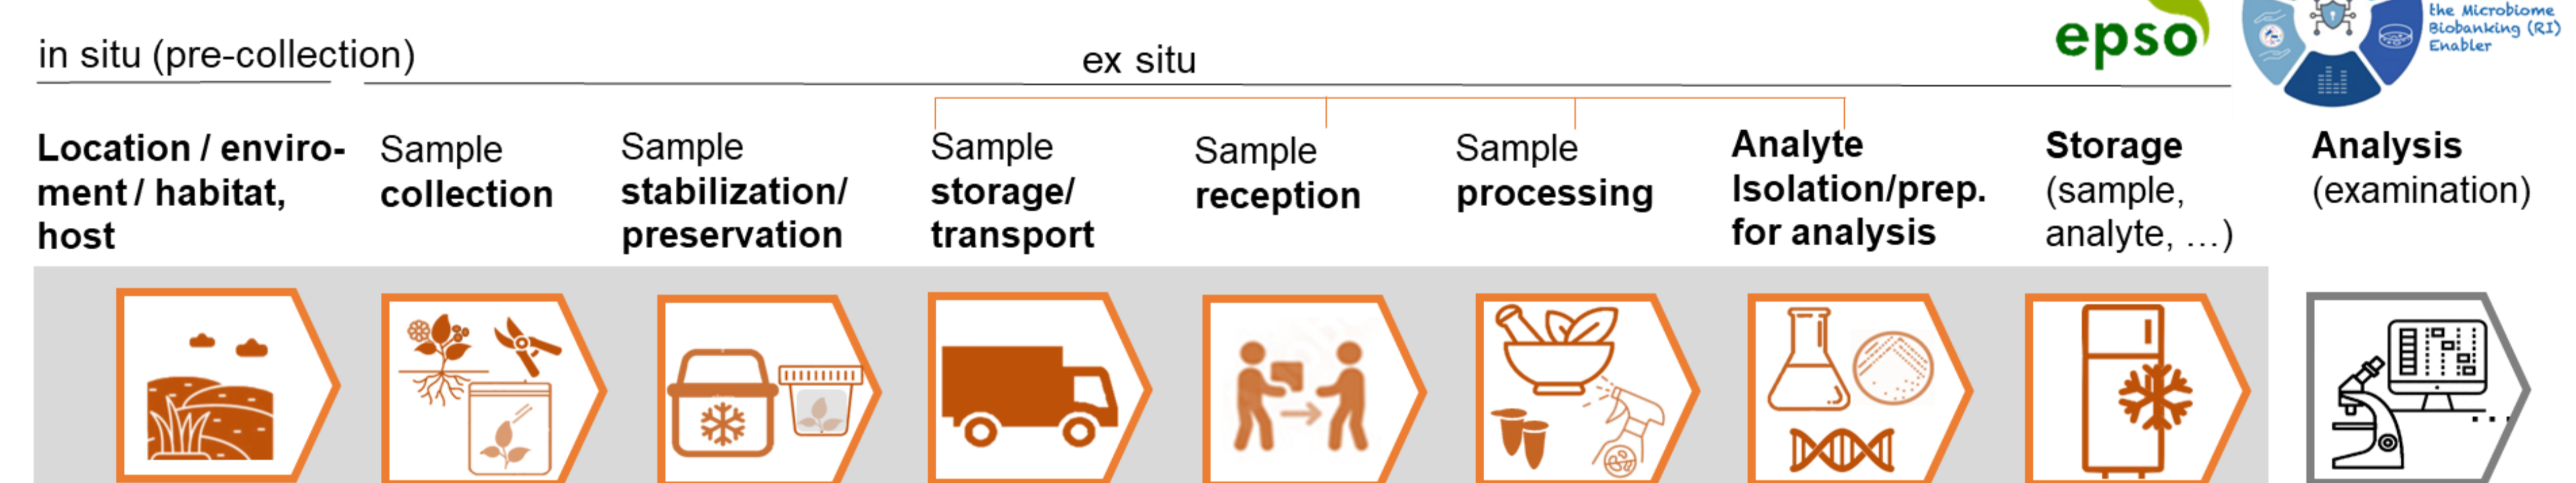

## Material & Methods

Within the EU-funded project MICROBE and its dedicated work package on "Standardization & Quality Control", we used CEN/TS 17626:2021 as a reference framework. A structured literature review and workshops involving non-human microbiome experts from the European Plant Science Organisation (EPSO) and/or MICROBE (for soil, plant, marine) were performed.

## Results

- Pre-analytical workflows for plant, soil and marine microbiome samples were defined covering multiple steps from the in situ location to long-term storage.
- Across these steps, key variables were identified that can influence microbiome composition and biomolecule (e.g. DNA) profile and quality.
- Pre-analytics can profoundly distort microbiome data through microbial shifts, degradation, contamination, extraction bias, inhibition, and host DNA interference.

### Examples of pre-analytical variables for plant, soil, marine water microbiome analyses

### Major pre-analytical factors that can have a dramatic effect on the analysis result

Location/environment/habitat/host	Collection	Preservation	Storage/transport	Processing	DNA extraction
<ul style="list-style-type: none"> <li>Geography (GPS)</li> <li>Climate</li> <li>Plant/field, water management</li> <li>Type of environment</li> <li>Former weather</li> <li>Plant genetics</li> <li>Plant developm. stage</li> <li>Plant health/disease</li> <li>Soil/water type</li> <li>Soil/water properties</li> <li>(Legal/regulatory), ...</li> </ul>	<ul style="list-style-type: none"> <li>C. site heterogeneity</li> <li>C. procedure/method/devices</li> <li>C. date/time</li> <li>C. container</li> <li>Labelling</li> <li>Plant compartments/soil/water depth -&gt; heterogeneity</li> <li>Weather conditions during c.</li> <li>Water filtering (volume, µm)</li> <li>Water fraction separation</li> <li>...</li> </ul>	<ul style="list-style-type: none"> <li>Time-point (in field or lab)</li> <li>Method</li> <li>Reagents</li> <li>Temp.</li> <li>...</li> </ul>	<ul style="list-style-type: none"> <li>Duration</li> <li>Condition (Temp., ...)</li> </ul>	<ul style="list-style-type: none"> <li>Sieving</li> <li>Homogenization</li> <li>Surface sterilization</li> <li>Filtration</li> <li>Aliquotting</li> <li>Pooling</li> <li>...</li> </ul>	<ul style="list-style-type: none"> <li>Method</li> <li>Kit/reagents</li> <li>Host cell lysis</li> <li>Microbiome lysis</li> <li>Inhibitors in sample</li> <li>Host DNA</li> <li>..</li> </ul>

Color.code: plant, soil, marine water-specific; for all, (Cross-)contamination

### Major pre-analytic effects on microbiome data:

- Unintended microbial growth or loss
- Biomolecule degradation (e.g. DNA)
- Contamination
- Extraction bias (differential lysis)
- Inhibition of downstream reactions
- Reduced sequencing efficiency (host DNA)

## Discussion & Conclusion

**Systematic mapping of pre-analytical workflows and variables provides a foundation for harmonized procedures and standardized metadata collection in non-human microbiome research..**

These are essential to reduce variability, improve reproducibility, and enable interoperable microbiome biobanking and research in a One Health context.
